PROFILE

I build with customers: own the ambiguous engagement end to end — discover the unclear problem, design the architecture, prototype rapidly, and turn field friction into product direction. My 0→1 motion is production-grade prototyping with AI coding harnesses: scope a narrow proof, ship it, harden what carries load. The tool layer behind my agents is **65** authored MCP connectors — governed API integrations with typed contracts and audit receipts — the same reusable-solution-building the AI Build team does across POC engagements.

Three years as a founder running an evidence-grade agent control plane from Honolulu: API and integration design as the product surface; typed handoff contracts and schema validation on every tool boundary; failure-injection recovery in every engagement I ship; full run traces feeding field evidence back into product iteration. Python primary, pragmatic polyglot, fluent in the AI-native build loop — ship, measure, iterate at startup speed.

CORE COMPETENCIES

Customer delivery: customer discovery · ambiguous-scope engagement ownership · rapid solution design & prototyping · POC scoping → activation · field friction → product requirements · reusable reference architectures & playbooks · lead through influence, no formal authority · trusted builder relationships

AI & Integration: 0→1 prototyping with AI coding harnesses · agent runtimes · API design & integration · **65** authored MCP connectors · typed handoff contracts · JSON Schema / Pydantic-style validation · function calling · structured outputs · parallel tool orchestration · RAG · evaluation harnesses · failure-injection recovery · fail-closed governance

Production: Python (primary) · TypeScript / JavaScript · SQL · Bash · REST APIs · GitHub Actions (CI/CD) · Postgres · webhooks · streaming workflows · per-task latency & token-cost instrumentation · retry logic · observability & run logging · CI regression gates · documentation engineers actually read

EXPERIENCE

Founder / Applied AI Systems Architect 2023 – Present

GlacierEQ — Honolulu, HI

- Own ambiguous 0→1 engagements end to end: discover the unclear problem, design the architecture, prototype rapidly with AI coding harnesses, and establish credible paths to production — balancing immediate outcomes with reusable solutions.
- Design integrations that span products: distinguish implementation gaps from core product gaps; determine whether a blocker needs configuration, integration work, custom development, or a roadmap change — and feed field evidence back into product iteration.
- Build the tools layer agents and customers consume: author **65** MCP connectors — governed API integrations with strict validation, structured resource submission, evidence boundaries, and audit receipts — the reusable-prototype pattern the AI Build motion requires.

- Turn one engagement into many: convert successful field work into reference architectures, reusable prototypes, implementation playbooks, and solution components with handover discipline — outcomes built to transfer to long-term owners.
- Design for failure in every engagement: failure-injection recovery, fail-closed gates, behavioral assertions, and recovery restricted to evidence declared before reassessment — POCs that behave like production because they are evaluated like production.
- Run an evidence-grade agent control plane across a **1,413-repository** estate: guardrails, typed handoff contracts, human approval gates on consequential actions — backed by a **989-test** suite, **95/95** verification checks green.

EDUCATION

University of Hawaii at Manoa 2016
Bachelor of Science

AWS Cloud Institute 2025
Cloud Computing program

Colorado State University
Undergraduate coursework

SELECTED PROOF

Job-App Helix — evaluation-gated campaign engine

- Attributable campaign engine with immutable evidence models and fail-closed **GO / NO-GO** decisions — the 0→1 POC discipline: scope narrow, ship fast, gate on evidence.
- Field-to-product feedback loop in practice: trace and run evidence feeding prompt and configuration iteration — the same loop the AI Build team runs for Stripe's roadmap.

GlacierEQ estate — production agent systems

- Durable patterns for claim tracking, evidence boundaries, audit receipts, and human-in-the-loop control across the full estate.
- Per-task latency and token-cost instrumentation driving every configuration tradeoff — measured delivery, not vibes.

SKILLS

Languages: Python · TypeScript / JavaScript · SQL · Bash · Node.js

Customer delivery: discovery & scoping · rapid prototyping · POC lifecycle ownership · field-to-roadmap feedback · reusable reference architectures · cross-functional coordination · technical writing & playbooks

AI / Integration: AI-native build loop · agent runtimes · API design & integration · MCP servers & connectors · eval harnesses · failure-injection recovery · function calling · structured outputs · guardrails · fail-closed recovery · trace intelligence

Evidence boundary: portfolio repositories are independent work. No enterprise customer logos, no payments-domain production claims, no named-AI-coding-tool endorsements. GitHub is the forge of record.
