PROFILE

Technical quarterback for AI sales cycles: I translate a prospect's architecture, use cases, and constraints into demos that answer their actual questions, solution designs they can defend internally, and POCs scoped with honest success criteria. Three years as a founder doing exactly that motion — technical discovery, customized demonstrations, architecture design under pressure, and technical objections handled with measured evidence instead of slides. The feedback loop runs both ways: field friction becomes product requirements written for engineers.

The hands are real: **65** authored MCP connectors — governed API/data-source integrations with typed contracts, structured validation, auth/access patterns, and audit receipts — plus integration-side work with the OpenRouter API (estate repo, independent work). Eval harnesses with written rubrics (LLM-as-a-judge) keep every demo and POC honest: measured latency, cost, and quality, not claims. Customer-first founder/operator depth (three years), honestly stated — no enterprise sales-engineering track record, no enterprise logos claimed.

CORE COMPETENCIES

Customer engineering: technical discovery · solution architecture · customized demos · POC environments · technical objections · competitive positioning · executive-friendly explanation · field-to-product feedback

API & integration: 65 authored MCP connectors · REST APIs · typed contracts · structured validation · auth/access patterns · SLA-shaped thinking · multi-provider routing patterns (integration-side)

Agentic AI: agentic workflows (reason / plan / act) · tool use & function calling · structured outputs · MCP · RAG · guardrails · fail-closed recovery · human-in-the-loop gates

Evaluation & quality: eval harnesses · golden datasets · behavioral assertions · LLM-as-a-judge with written rubrics · success-criteria framing · latency & token-cost instrumentation · failure analysis

Production: Python (primary) · TypeScript · SQL · Bash · JSON Schema / Pydantic-style validation · GitHub Actions (CI/CD) · Postgres · retry logic · observability

EXPERIENCE

Founder / Applied AI Systems Architect 2023 – Present
GlacierEQ — Honolulu, HI

- Lead the customer-engineering motion end to end: technical discovery with operators, customized demonstrations built around their actual use cases, solution architectures they can defend internally, and POC environments scoped with written success criteria.
- Answer technical objections with measured evidence, not decks: latency, cost, and quality numbers from real runs — routing, model-selection, and architecture tradeoffs defended by the data.
- Integrate deeply with customer stacks through **65** authored MCP connectors — governed API/data-source connections with typed contracts, structured validation, and audit receipts on every boundary; enterprise-style identity/access patterns (approval gates, access controls) are native to the integration layer.

• Build integration-side familiarity with model-routing platforms: estate work exercises provider-routing APIs (OpenRouter integration-side, independent work) — model switching by cost/quality economics, failover and latency instrumentation.

• Close the field-to-product loop: operator friction captured, instrumented, and written into engineering-ready requirements — customer feedback that actually changes what gets built.

• Gate every shipped demo and deployment with evaluation harnesses: golden datasets, behavioral assertions, LLM-as-a-judge with written rubrics — **989-test** suite, **62/62** verification checks green, fail-closed recovery across an **1398-repository** estate (live-verified 2026-10-20).

EDUCATION

University of Hawaii at Manoa **2016**
Bachelor of Science

AWS Cloud Institute 2025
Cloud Computing program

Colorado State University
Undergraduate coursework

SELECTED PROOF

Governed integration layer — 65 authored MCP connectors

• Governed tool/API/data-source connections with typed contracts and structured validation on every boundary — the reusable integration layer behind every deployed agent engagement.

• Connectors span enterprise-style identity/access patterns: approval gates, access controls, audit receipts — the auth and governance surface customer engineers actually demo.

Evaluation-gated quality — demos measured, not claimed

• Evaluation harnesses with written rubrics gate every demo and deployment: judge criteria declared up front, behavioral assertions enforced, trace intelligence feeding iteration.

• Job-App Helix campaign engine — immutable evidence models, fail-closed GO / NO-GO decisions: the POC discipline of declared success criteria, applied to every run.

SKILLS

Languages: Python · TypeScript · SQL · Bash · JavaScript / Node.js

Customer engineering: technical discovery · demos & POCs · solution architecture · technical objections · competitive positioning · customer success posture · technical writing

Agentic AI: agent workflows · tool/function calling · MCP · structured outputs · RAG · eval harnesses · LLM-as-a-judge · trace intelligence · guardrails

Production: REST APIs · Postgres · CI/CD (GitHub Actions) · JSON Schema validation · observability · latency & token-cost instrumentation · retry logic

Evidence boundary: portfolio repositories are independent work. Founder/operator customer-facing depth (three years), honestly stated — no enterprise sales-engineering track record, no enterprise customer logos claimed. OpenRouter experience is integration-side (as a builder on the API), not OpenRouter-internal platform work. No Go / GCP / GraphQL / K8s / Terraform / data-science-statistics depth claimed. GitHub is the forge of record.
