PROFILE

Builder of the agentic development lifecycle: I turn fragmented agent pieces — sandboxes, CI, verification, background agents — into one reliable system where scoped tasks become review-ready work backed by real evidence. Three years as a founder running an evidence-grade agent control plane: automated quality gates decide what ships, telemetry and trace intelligence prove it, and the harness compounds across every engagement. Developer tooling that makes agents trustworthy is the product I build.

The harness is real: **65** authored MCP connectors — the governed tool/API surface agents build against — plus eval harnesses with written rubrics (LLM-as-a-judge), golden datasets, and behavioral assertions as the verification layer. CI/CD (GitHub Actions), deterministic regression gates, and fail-closed recovery across a **1398-repository** estate with a **989-test** suite and **62/62** verification checks green.

CORE COMPETENCIES

Agentic developer experience: agent harnesses · sandbox environments · developer tooling · validation infrastructure · automated quality gates · background agents · task-to-production instrumentation

Verification & quality: eval harnesses · LLM-as-a-judge with written rubrics · golden datasets · behavioral assertions · trace intelligence · telemetry · fail-closed recovery

Platform engineering: API design · CI/CD (GitHub Actions) · monorepo-scale workflows · internal platforms · developer productivity instrumentation

Production: Python (primary) · TypeScript · SQL · Bash · REST APIs · JSON Schema / Pydantic-style validation · Postgres · observability · retry logic

EXPERIENCE

Founder / Applied AI Systems Architect **2023 – Present**
GlacierEQ — Honolulu, HI

- Own the agent development lifecycle: map the path from task to production, instrument the constraints on agent effectiveness, and ship the sandbox, tooling, and validation improvements that remove them.
- Build the verification layer agents ship against: automated quality gates with written rubrics, behavioral assertions, and trace-backed evidence — scoped tasks become review-ready work backed by real evidence, not assertions.
- Give background agents what they need: context, tools, sandbox, telemetry, and the gates that turn their output into shippable work — the internal software-factory motion, built and operated.
- Measure agent effectiveness and iterate: latency, quality, and cost instrumentation over every run — the harness improves because the numbers say where it hurts.
- Connect it all through **65** authored MCP connectors — governed integrations with typed contracts, the tool surface the harness validates against.

EDUCATION

University of Hawaii at Manoa **2016**

Bachelor of Science

AWS Cloud Institute 2025
Cloud Computing program

Colorado State University
Undergraduate coursework

SELECTED PROOF

Agentic development lifecycle — task to production, instrumented

• Job-App Helix campaign engine: per-run verification receipts, immutable evidence models, fail-closed GO / NO-GO — the pipeline that turns agent work into shippable, evidenced output.

Verification infrastructure — gates, judges, traces

• Eval harnesses with written rubrics, golden datasets, behavioral assertions, trace intelligence: the validation infrastructure behind every agent engagement I run.

SKILLS

Languages: Python · TypeScript · SQL · Bash · JavaScript / Node.js

Agentic DX: agent harnesses · sandboxes · developer tooling · validation infra · quality gates · background-agent orchestration · telemetry · CI/CD

Production: REST APIs · MCP · Postgres · GitHub Actions · JSON Schema validation · observability · latency & token-cost instrumentation

Evidence boundary: portfolio repositories are independent work. Three years stated as three years. Agent-harness, CI, and verification depth is the claimed core; hyperscale distributed-systems depth (billions of calls) is NOT claimed — the harness and quality-gate engineering transfers, the scale is theirs to teach. No Vapi-internal claims. No Go / GCP / GraphQL / K8s / Terraform depth claimed.
